

Priority Queue

Function	Explanation	Syntax	Complexity
1) push	insert an element	pq.push(5)	$O(\log n)$
2) pop	remove the top element	pq.pop()	$O(\log n)$
3) top	get the top element	pq.top()	$O(1)$
4) size	get the number of elements of the priority queue	pq.size()	$O(1)$
5) empty	check if the priority queue is empty	pq.empty()	$O(1)$
